

Information about the dataset

The dataset is downloaded from Kaggle from this link — <https://www.kaggle.com/iarunava/cell-images-for-detecting-malaria>. The dataset was originally taken from the NIH website and uploaded to a Kaggle repository. The dataset contains 27558 cell images. Out of these 27558 images, we have 13779 cell images which are infected by *Malaria* and another 13779 images which are uninfected. If you visit this [link](#), you can read more about a mobile application that a team of researches have built which can directly detect Malaria using a smartphone! How cool is that?
